1: Online Symposium Portal

A college is developing an online symposium registration portal. The following HTML structure and HTTP interaction is observed:

```
<form action="/register" method="POST">  
<input type="text" name="name">  
<input type="email" name="email">  
<button>Submit</button>  
</form>
```

When a student submits the form, the browser sends an HTTP request to the server, and the server responds accordingly.

1. Identify appropriate HTML5 semantic elements missing in the structure.

HTML CODE:

```
<!DOCTYPE html>  
<html lang="en">  
<head>  
<meta charset="UTF-8">  
<meta name="viewport" content="width=device-width, initial-scale=1.0">  
<title>Online Symposium Registration</title>
```

</head>

<body>

<header>

<h1>Online Symposium Registration</h1>

</header>

<main>

<section>

<form action="/register" method="POST">

<label>Name</label>

<input type="text" name="name" required>

<label>Email</label>

<input type="email" name="email" required>

<button type="submit">Submit</button>

</form>

</section>

</main>

```
<footer>

<p>SIMATS Engineering</p>

</footer>

</body>

</html>
```

OUTPUT

A screenshot of a web form titled "Online Symposium Registration". The form has a light gray background. It contains two input fields: "Name" with the value "Akash Akkurthi" and "Email" with the value "akkurthiakash2@gmail.co". To the right of the email field is a "Submit" button. Below the input fields, the text "SIMATS Engineering" is displayed.

Online Symposium Registration

Name Email

SIMATS Engineering

EXPLANATION:

1. Missing HTML5 Elements

The form is missing semantic tags like `<header>` and `<main>`. These tags make the webpage organized and easy to understand.

2. Standards Compliance

The HTML uses proper tags and follows HTML5 standards. This makes the webpage valid and easy to maintain.

3. HTTP Request

When the user clicks **Submit**, the browser sends a **POST** request to the server. The entered name and email are sent with the request.

4. HTTP Response

The server receives the request, processes the data, and returns a response such as "Registration Successful."

5. Improvements

- Use labels for inputs.
- Add required validation.
- Use HTTPS for secure communication.

2: Cross-Browser Compatibility Issue:

A company website shows inconsistent layout across browsers.

The following HTML snippet is used: <html>

```
<head>
```

```
<title>Company</title>
```

```
</head>
```

```
<body>
```

```
<div>
```

```
<h1>Welcome
```

```
<p>About us
```

```
</div>
```

```
</body>
```

```
</html>
```

HTML CODE:

```
<!DOCTYPE html>
```

```
<html>
```

```
<head>
```

```
    <title>Company</title>
```

```
</head>
```

```
<body>
```

```
<header>

  <h1>Welcome</h1>

</header>

<section>

  <p>About Us</p>

</section>

</body>

</html>
```

OUTPUT:

EXPLANATION:

1. Errors

The original code had missing closing tags for `<h1>` and `<p>`.

2. Browser Behavior

Different browsers may display incorrect layouts if HTML tags are missing.

3. Semantic Elements

`<header>` and `<section>` improve webpage organization.

4. Correct HTML

The corrected HTML uses proper opening and closing tags.

5. Compatibility

- Test in Chrome, Firefox, and Edge.
- Use valid HTML5.
- Validate using the W3C Validator.

3. Form Submission Failure :

A web application fails to send form data to the server. The following configuration is observed: <form action="/submit" method="GET">

<input type="text" name="username">

<input type="password" name="password">

<button type="button">Login</button>

</form>

HTML CODE:

<!DOCTYPE html>

<html>

<head>

<title>Login Form</title>

</head>

<body>

<form action="/submit" method="POST">

Username:

<input type="text" name="username" required>

Password:

<input type="password" name="password" required>

<button type="submit">Login</button>

</form>

</body>

</html>

OUTPUT:

The screenshot shows a web browser window with a tab labeled 'HTML'. The page content is a simple login form. It has a label 'Username:' followed by a text input field. Below that is a label 'Password:' followed by a password input field. At the bottom left of the form is a button labeled 'Login'.

EXPLANATION:

1. Issues

The original form used `type="button"`, which does not submit the form. It also used the GET method for login.

2. Why Form Was Not Submitted

Because the button was not a submit button, clicking it did not send any request to the server.

3. GET Method

The GET method sends data through the URL, which is not secure for passwords.

4. Correct Implementation

The form now uses:

- `method="POST"`
- `type="submit"`

5. Security Improvements

Use HTTPS.
